Levulinic Acid - ^{14}C and Levulinic Acid - ^{14}C
Nitrile and Levulinic Acid - ^{14}C

Der. Kim, Thur., 21/6, 721-722, Dec 1955

A new method is described for the synthesis of levulinic acid - ^{14}C from NaC^{14}O and methyl-beta-chloroethylketone. Saponification of the obtained nitrile in hydrochloric acid led to the formation of levulinic acid - ^{14}C . The effect of temperature on the yield of levulinic acid nitrile is explained. Three references: 1 USA, 1 Germ, and 1 Fr. (1936-1949).

Title : The Formation in Kok-Sagyz Leaves of Carbonic Acid From
Sugars and Acids Containing Marked Carbon

Orig Pub: Byul. po fiziol. rasteniy, 1957, No 1, 15-19.

Abstract: Water solutions of sugars and sodium salts of organic acids containing C¹⁴ were applied to kok-sagyz leaves (three portions over the course of three days or in one dose before the beginning of the experiment. The air was withdrawn from the plant by use of a vacuum dessicator; the carbon dioxide, absorbable in 25% NaOH, was precipitated, and the radioactivity measured in the dried BaCO₃ deposit. It was observed that a considerable

Abs Jour: Ref. Zhur-Biologiya, No 1, 1958, 1142.

quantity of C^{14}O_2 was isolated two or three hours after introduction of the marked elements. On the fifth or sixth day of the experiment, after application of saccharose C^{14} , α -glucose-1- C^{14} , acetic acid-1- C^{14} , pyroacemic acid-2- C^{14} , levulinic acid-1- C^{14} , levulinic acid- C^{14} , and glycocoll-1- C^{14} in darkness, more than 50% of the introduced radioactivity was isolated. 25% of the radioactivity was isolated upon introduction of -fructose-1- C^{14} and α -gluconic acid 1- C^{14} . In the experiments with levulinic acid C^{14} and pyroacemic acid-1- C^{14} , from 33-20% [sic] more C^{14}O_2 was isolated in the light than in darkness. As concerns the other substances, the differences between the light and dark variants were imperceptible.

TITLE: On the Mechanism of Fat Biosynthesis in Maturing Flax Seeds. (K Voprosu O Mekhanizme Biosinteza Zhira v Sozrevayushchikh Semenakh L'na.)

PERIODICAL: Ukrainskiy Khimicheskiy Zhurnal, 1957, Vol. 23, No.1, pp. 85 - 88 (USSR).

ABSTRACT: The distribution of radioactive carbon C¹⁴ was investigated in fractions of glycerine and fatty acids separated from fats of flax seeds. The transformation of saccharose C¹⁴ of pyruvic acid-2-C¹⁴, acetic acid-1-C¹⁴ and glycocol-1-C¹⁴ into fat components, e.g. glycerine and fatty acids of ripening flax seeds was tested by various experiments. The radioactivity of aqueous fractions, of fatty acids and of glycerine is illustrated by graphs 1 - 3. It was shown during the investigations that the acetyl-coenzyme A is synthesised directly from acetic acid and also during the metabolism of carbohydrates and oxidation-reduction processes of acids and aldehydes, e.g. of pyruvic acid. Obviously, the participation of these and other compounds during the synthesis of the acetyl-coenzyme A are linked with the characteristics of the organism or of the living tissues in which these processes take place. TITLE: On the mechanism of cellulose biosynthesis in developing flax stems. (K voprosu o mekhanizme biosinteza tsellyulozy v formiruyushchikhsya stelyakh l'na).

PERIODICAL: "Ukrainskiy Khimicheskiy Zhurnal" (Ukrainian Journal of Chemistry), Vol.23, No.2, March-April, 1957, pp.233-235 (USSR).

ABSTRACT: Previously published investigations (1) proved that cellulose is formed in higher plants and some microorganisms at the expense of glucose which is synthesised by these organisms. Experiments carried out by Gritkhaus concerning the study of the biosynthesis of cellulose of cotton fibres. By incising the stem immediately under the boll glucose- C^{14} was injected. The thus treated boll ripened in 30 days. Investigations of the distribution of radioactivity showed that 99.97% of the total activity of this sugar occurs in the first C atom. The author concluded that cellulose in cotton fibres is formed by the direct polymerisation of glucose molecules by utilising the energy of phosphorylation. The authors attempted to elucidate the action of saccharose C^{14} , acetic acid- l-C^{14} , glycine- l-C^{14}

Card 1/2

On the mechanism of cellulose biosynthesis in developing flax stems. (Cont.)

and pyruvic acid-2-C¹⁴ during the synthesis of cellulose in flax stems. Labelled saccharose-C¹⁴ and glycine-1-C¹⁴ were proved to impart the highest activity. The distribution of radioactivity in cellulose fractions extracted from bast and flax stems is shown in Diagrams 1 and 2. It can be seen that the C¹⁴ atoms pass into the cellulose molecules in various quantities. It is suggested that glycine transforms to d-glucose via the formation of triose.

There are 2 diagrams and 6 references, 3 of which are Slavic.

TITLE: Catalytic Action of Amino Acids and Amines in Organic Reactions. 2. Kinetics and Mechanism of Enolisation of Levulinic Acid in the Presence of Glycine and Other Amino Acids. (Kataliticheskiye Deystviya Aminokislot i Aminov v Organicheskikh Reaktsiyakh. 2. Kinetika i Mekhanizm Yenolizatsii Levulinovoy Kisloty v Prisutstvii Glikokola i Drugikh Aminokislot)

PERIODICAL: Ukrainskiy Khimicheskiy Zhurnal, 1957, Vol. 23, No. 3, pp. 333-340 (USSR).

ABSTRACT: The first communication gave results of investigations on the kinetics of enolisation of acetone in the presence of amino acids. (Ref.1) Data on the kinetics of iodination of levulinic acid under the above mentioned conditions are investigated in the present article. Levulinic acid differs from acetone in the fact that it contains an acid group which occurs in 2 forms: the undissociated acid (the concentration being denoted as M) and the acid ion (M^-). M = total concentration of the undissociated acid and its ion. Investigations have shown that the iodination of levulinic acid in the presence of amino acids is limited by the enol formation stage. It can be assumed that 3- or 5-iodolevulinic acid is formed in the first instance. The structure of the iodination products

Card 1/4

73-3-8/24

Catalytic Action of Amino Acids and Amines in Organic Reactions.
2. Kinetics and Mechanism of Enolisation of Levulinic Acid in the
Presence of Glycine and Other Amino Acids.

was not investigated. The method of measuring the rate of iodination was described in part 1. (Ref. 1). Direct titration in acidified solutions was used. This method of titration was found suitable. The synthesised levulinic acid was subjected to 2 vacuum distillations. Fractions boiling at 137 - 139°C at 10 mm Hg. Iodine sublimates from the pulverised mixture with potassium iodide. Chemically pure glycine was used for the experiment. Figure 1 shows that the rate of iodination of levulinic acid increases with increasing concentration of glycine and of the hydroxyl-ion. The rate of iodination does not depend on the concentration of the iodine, G_{I} , and is, as in the case of acetone, defined by the stage of enolisation according to the kinetic equation: $v = k_0 M$. At comparatively high concentrations of levulinic acid the reaction rate is represented by straight lines. At 0.5 mole concentrations of levulinic acid, in the presence of 0.005 mole I_2 and 1.25 mole glycine a fast reaction occurs until 10% of I is spent (Fig. 2).

Card 2/4

73-3-8/24

Catalytic Action of Amino Acids and Amines in Organic Reactions.
2. Kinetics and Mechanism of Enolisation of Levulinic Acid in the
Presence of Glycine and Other Amino Acids.

Thereafter the reaction rate decreases. In the presence of glycine the rate of enolisation of levulinic acid depends on the pH of the solution (viz. Fig. 3). At low pH (4.5 - 6) the constant k_0 does not increase appreciably with increasing pH, with more alkaline solutions the rate increases sharply. Table 1 gives values for k_0 and $k'K_2^2$ (where $K_2 = 2.5 \times 10^{-10}$). The addition of buffer salts (diphthalates) denoted as B in the table, does not affect appreciably the aforementioned values. The value of $k'K_2^2$ at pH 4.8 - 6 equals 1.1×10^{-8} , i.e. $k' = 44$. Just as in the calculation of acetone the authors found that the concentration of glycine appears in the equation as G^2 . Table 2 gives the calculated values for kK_2 where

$$k = \frac{k_0 a_{N+}}{K_2 G^2}$$

At pH 6 the rate of enolisation of levulinic acid increases with the concentration of the added buffer phosphate salt (F). Figure 1 and Table 3 show the relation between k and pH in the presence of phosphates. Several experiments

Card 3/4

73-3-8/24

2. Kinetics and Mechanism of Enolisation of Levulinic Acid in the
Presence of Glycine and Other Amino Acids.

with various amino acids in the presence of phosphates at 25°C were carried out in order to compare their catalytic action. Table 4 gives the k_1 values for these experiments. Table 5 gives data for the relation of the rate of enolisation and the temperature. The energy of activation was 18750 cal. The kinetic equation for pH 4.5 - 9 was found to be

At 25° C: $k'_2 = 44$; $k = 0.68$; $k' = 64$ units: mole/litre, minute). The donor - acceptor scheme of enolisation of ketones in the presence of amino acids and proton donors is discussed. There are 3 figures, 5 tables and 5 references, 2 of which are Slavic.

TITLE: Epidotization in the Granitoidal Rocks of the Osničkiy
Kompleks (Complex) in Volyn (Epidotizatsiya granitoidov
osničskogo kompleksa Volyni)

PERIODICAL: Mineralog. sb. L'vovsk. geolog. o-vo pri un-te, 1955,
Nr 10, pp 288-297

ABSTRACT: The granitoidal rocks of the Osničkiy complex are
divided into the older Klesov aplite-granites and
microgranites and the younger Osničkiy granites.
Intensive alteration on a regional scale is character-
istic of both. This alteration was associated with
post-magmatic processes, of which epidotization is the
most common. Some systematic patterns are found in the
distribution of secondary minerals: 1) dark minerals
as well as plagioclase have been altered; 2) as a result

Card 1/2

15-57-4-4478

Epidotization in the Granitoidal Rocks (Cont.)

of the change in the composition of the rock, the products of secondary replacement became different too; 3) the development of more basic plagioclase and the increase of CaO in general led to an increased quantity of epidote; and 4) the rock was altered without marked disturbance of the chemical composition, discounting the absorption of H₂O and CO₂. Epidote that developed within crystals of plagioclase is different in iron content from the epidote that formed near the dark minerals. Large accumulations of green epidote are found in the Klesov region in pegmatite veins. A chemical analysis of dark green epidote gives the following composition (in percent): SiO₂ 37.46, TiO₂ 0.18, Al₂O₃ 23.25, Fe₂O₃ 13.16, FeO 1.43, MnO 0.25, MgO 0.58, CaO 22.63, H₂O+ 0.18, H₂O- 1.60; total 100.72. This analysis corresponds to common iron-bearing varieties. The thermal curve shows a distinct endothermic effect at 97°C. For the epidote to form it is necessary that iron be derived from the dark minerals. The change in the feldspars in the Osnitskiy granitoidal rocks has been shown in a three-component diagram for the system CaO-½Al₂O₃-½K₂O. The change in the dark constituents has been shown in a diagram for the system (Mg, Fe)O-½Al₂O₃-CaO.

The authors describe 19 cases of pulmonary paragonimiasis in patients from the Far East. Attention is called to the most important radiological changes and some experiences from the laboratory are reported. The correct diagnosis is made not only by the presence of haemoptysis, positive radiological findings, and the discovery of the ova of the parasite in the sputum, but, if the patient happens to be in the negative phase, by the fact that he was living in endemic areas. The authors underline the importance of a thorough radiological and tomographical examination. (XV, 7, 14)

OBSTRUCTIVE osteosclerosis.

A 50-year-old patient undergoing X-ray therapy for a hyperthyroid chromophobe adenoma received a series of treatments (total dose 20,900 r) including transfusions and vitamin therapy over a period of 3 years. The patient's general health was good and the blood count never dropped below normal. When the patient appeared for the fifth series of treatments, radiologists disclosed cranial bone changes at the radiation sites and during the development of osteonecrosis and mild osteosclerosis. During the sixth series the radiation fields were changed and the patient received a 4,500 r dose bringing the cumulative dose for all
